

C-1 glass SR1000 Series can be used for exterior coating as well as coating roofs and concrete walls.

■ Coating the roofs of homes

It will block strong UV rays and will not lead to cracks and wear over a long period of time.

■ Protective coating for concrete walls

It protects the concrete and prevents stains from rain.

■ Coating of rooftops

It reduces UV rays and prevents leakage of rain.

Features of C-1 glass SR1000

○ Exceptional Anti-Stain Property

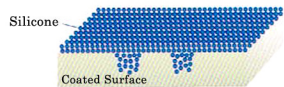

One of the features of the C-1 glass SR1000 is the hydrophilic property which works together with the self-cleaning feature of using rainwater to maintain the visual appearance of the coated surface.

○ Exceptional Durability and Highly Weatherable Property

It chemically reacts to the water in the air to harden and changes into glass (silicon) to create a durable and highly weatherable property that is not present in other oil-based coating in the past.

○ Elasticity and Followability

The SR1000 has an innovative film coating that features an inorganic molecular sequence that provides an elastic property and prevents cracks and tears of the film over a long term period.

The silicone can cover bumps due to its nano-structure for a strong adhesion. The film coating with the nano structure will provide a fine and beautiful appearance.

C-1 glass

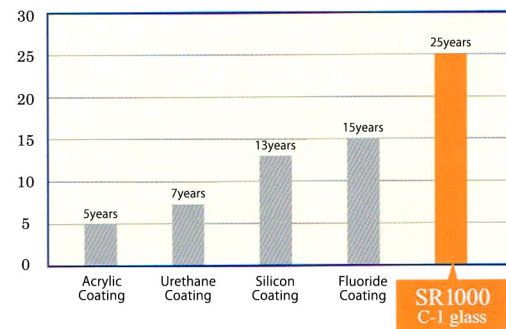

It will adhere over a long term period as rain water will not seep in thanks to the nano film coating.

○ Permeability

The film coating has excellent permeability thus it prevents condensation inside the building.

Estimated Recoating Cycle

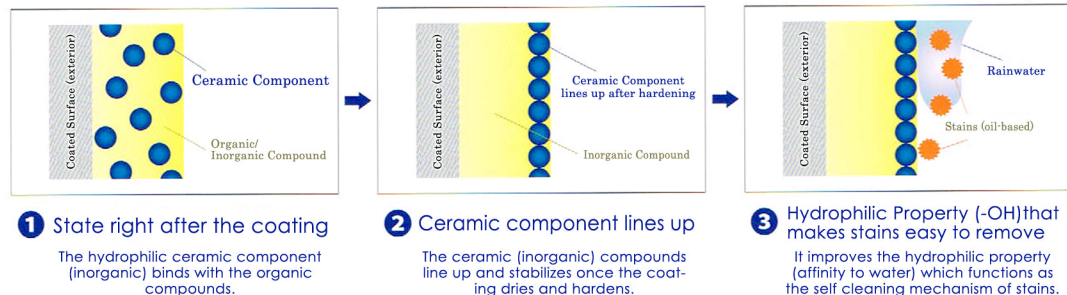

A comparative chart in years of the recoating cycle based on weather testing (80% gloss retention).

* Each paint listed above are based on commonly used coatings.

* The data based on accelerated natural weathering is an estimate thus it is not a guaranteed number.
